

Tech Note:

Using Multiple PowerFlare Chargers with a Single Power Input

From time to time we are asked why there are two power connectors on the back of our rechargeable system chargers. One is intended for input power, and the other is intended to power another unit using a CABL-004. They are identical and either one can serve as input or output, depending upon the installer's preference.

- 1. When using the standard CABL-001 that comes with the kits, connected to a 12V automotive power point (cigar lighter), up to 5 (five) units can be connected to the same CABL-001 (with purchase of an additional CABL-004 per additional unit)

- 2. When using the ACDC-001 120v wall adapter (optional), up to three units can be connected to the same ACDC-001 (with purchase of an additional CABL-004 per additional unit).

- 3. When using an ACDC-002 connected to a CABL-001, only ONE unit can be powered effectively—no chaining will work without decreased charging effectiveness.
